

SECTION-I

FOREST RESOURCE

FOREST RESOURCE

Forests constitute an important component of India covering about 23% of its geographic area. They not only provide intangible services like protection of environment, clean air and water but also provide subsistence to dwellers of villages in and around them. They also have a potential of supporting livelihoods and, in the process, participate in poverty alleviation. Apart from this there are some auxiliary resources associated with forests like grazing land, wastelands, etc, which have a potential to provide space for tree cover. Further, not all land belonging to forest departments is under tree cover. India had rich forest resource in the past and was extended over major part of the country. With time, deforestation for cultivation, food, shelter and pasture, diversion for developmental purposes and removal of valuable timber trees affected the forest resources adversely.

The periodic assessment and monitoring the forest and tree cover of the country is mandated to Forest Survey of India. The forest cover is assessed using satellite images and following wall to wall approach on every two years. So far the forest cover has been assessed eleven times. As per the last report of Forest Survey of India published in 2011, the total forest cover of the country has been assessed to be 692027 square km., which constitutes about 21.05 per cent geographic area of the country (Table 1.1). Area managed by the forest department may be classified as reserved, protected and unclassed (Table 1.2).

Plantation Statistics

Plantations are regularly undertaken by the state forest departments under various schemes, both centrally sponsored and state funded schemes. Data pertaining to plantations raised under various schemes is difficult to obtain from each department as there are many departments involved. Establishment of forest plantations on a considerably large scale in India began during late 1970s early 1980s. Plantations were mostly established outside forest reserves in the wastelands and on private farm lands. Forest Development Corporations of various states also undertake plantations of forest tree species and have contributed to the increase in plantation area of commercially important forest tree species. Tree planting was declared a priority by the Government of India in 1982 in the Twenty-Point Programme, a package of Social Sector Schemes for the development of the county. The planting reached to approximately one million ha per annum during 1980-85. Further impetus to planting activities was given by creation of a National Wasteland Development Board in 1985 and the annual planting rate increased to about 1.78 million ha between 1985 and 1990. Plantation statistics for four year period 2006-2010 is presented state-wise in Table 1.4.

Wastelands of India

Wastelands constitute an important resource available to carry out tree planting activities. There are nine broad types of wastelands found in India:

- (i) Gullied/Ravenous Land
- (ii) Scrubland
- (iii) Waterlogged and Marshy Land
- (iv) Land affected by salinity and alkalinity
- (v) Shifting Cultivation
- (vi) Scrub Forest (underutilized notified forest land)
- (vii) Sands
- (viii) Mining Industrial Wasteland
- (ix) Others

Data on wastelands are taken from the Wasteland Atlas of India published by the Department of Land Resources, Government of India. The atlas is prepared by Department of Land Resources along with National Remote Sensing Centre and Indian Space Research Organization. The categories of waste land are presented in table 1.5(a) to 1.5(i). In all nine tables give in detailed status of waste land of states of India.

The presented data in this section are taken from the published annual reports of the state/UT forest departments and that available on the website and other sources.
